

On the Subject of One Links To All

So there's this theory that you can get from any Wikipedia article to another through just the hyperlinks in each article alone... Well let's test that theory!

This module has four displays with the ones on the top and bottom displaying a title of a random Wikipedia article, the leftmost middle one for displaying an article counter, the rightmost middle one for displaying user input, a keypad for entering user input, an add (+) button, a minus (-) button, a clear button, and a submit button.

To solve this module, open up the Wikipedia article with the title from the top display. Navigate from this article to the article with the title from the bottom display using only hyperlinks that go to another Wikipedia article. Be sure to note down the title of each article passed along the way. Once the article with the title from the bottom display has been navigated to, input the title of the first article passed from start to finish using the keypad and pressing the add button to add the next article. Keep adding articles until the last one passed, and then do not press add again. Attempting to add an article when the user input is empty will not do anything. If a mistake was made while inputting the clear or delete button may be pressed to clear all input or remove the most recent character from the input display. Pressing the minus button will remove the most recently added article (as long as the article counter is not 1) and pressing the submit button will submit all inputted articles. If no articles were passed by to get from start to finish, then just press submit with the article counter at 1 and an empty input display.

If a set of passed articles is submitted that does not lead from the starting to ending article in that order then a strike will be recorded but the module WILL NOT reset.

Keypad Key

Cp - Capital Letters

Lw - Lowercase Letters

Dm - Diacritic Letters (i.e. é ï ñ)

Mc - Miscellaneous Symbols (i.e. 3 □ -)

□ - Space

NOTE: The module may take time to get the articles and check submission as it connects with Wikipedia. If the module fails any of the processes, it will display an error. Press submit to solve the module if this happens.
